SUBJECT: Woodward GTC100 Installation Statement

To: Whom it may concern

The Woodward GTC100 controller is standard-off-the-shelf controller designed to control small to medium sized single shaft gas turbines. This controller was officially released for sale to turbine OEMs (original turbine manufacturers) and authorized Woodward RTRs (recognized turbine retrofitters) in 2005.

The GTC100 is a generic field configurable controller, which offers users a cost effective control system for new gas turbine packages as well as turbine upgrade and retrofit packages.

Since the release of this product line over twenty GTC100 controllers have been successfully commissioned in the field on a range of gas turbine types including Solar and Rolls Royce. Due to the success of this product line, Woodward is committed to supporting it for many production years to come, and are considering product line improvement projects in the future.

Best Regards,

Rich Kamphaus
Turbine Controls Product Line Manager
